rush search for 09/242,202

Hi, Chris:

Could you please give approval for rush search SEQ ID Nos: 10, 16, 22, 27, 28; residues 1-12 of SEQ ID No: 22; and residues 1-11 of SEQ ID No: 10 against all commerical databases including pending patent database.

This is an amended case.

Thanks,

Q. Janice Li Patent Examiner AU 1632 CM1, Rm12D11 Mail Box12E12 703-308-7942 janice.li@uspto.gov

GENERAL INFORMATION:
APPLICANT: Little, Roger
APPLICANT: Little, Roger
APPLICANT: Ammons, Steve
TITLE OF INVENTION: Therapeutic Uses of Bactericidal/Permeability-
TITLE OF INVENTION: Increasing Protein Dimer Products
NUMBER OF SEQUENCES: 11
CORRESPONDENCE ADDRESS:
ADDRESSEE: Marshall, O'Toole, Gerstein, Murray & Borun
STREET: 6300 Sears Tower, 233 South Wacker Drive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SOFTWARE: Patentin Release #1.0, Version #1.25

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This DNA sequence comprises a combined 3' splice sequence and polyA tail sequence derived from human gene sequences. Novel humanised vectors of the invention (see AAT21724, AAT21727 and AAT21732-34) comprise a human-derived promoter or mammalian homologue which is functional in mammalian target tissue and cells and an acceptance site which accepts cDNA products from RT-PCR cloning. They may also include human-derived splice-polyA sequences. The

                                                                                                                                                                                                                                                                                                                                                                          This DNA sequence comprises a combined 3' splice sequence and polyA tall sequence cloned into the Xho and HindIII sites of poBM-72f. Novel humanised vectors of the invention (see AAV21724, AAV21727 and AAV21732-34) comprise a human-derived promoter or mammalian homologue which is functional in mammalian target tissue and cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cloning. They may also include the splice-polyA signal and an acceptance site which accepts cDNA products from RT-PCR cloning. They may also include the splice-polyA signal RT-PCR sequence. After processing of mRNA, intron 31s exclised, and the sequence contains duplicate stop codons in 2 reading frames.

A 3rd reading frame stop codon can be obtained by mutagenising the internal ribosomal entry site (RRES). The vectors are used to express target antigens, especially tumour antigens. They are non-replicating in mammalian cells but are capable of extended stable expression of target sequences, and selectively elicit immune responses to the target sequences with little or no immune response to the target sequences with little or no immune capposes as intracellular polypeptides and are appropriately presented on antigen presenting cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       60 TAGTCAGAGCCCCCGGGCAGCACAGGCCAATGCCCGTCCTTCCCCTGCAGGATGAGTAGT 119

AAV21733 RESULT

(first entry)

17-AUG-1998

AAV21733;

Humanised vector pITL-1.

```
in mammalian target tissue and cells and a sequence acceptance site (see AAV21735-36) which accepts CDNA products from RT-PCR cloning. They also contain minimal non-human components, such as a replication origin (see AAV21715) and selectable marker gene (see AAV21717-18) that are necessary for production of the vector. The novel vectors are used to express target antigens, especially tumour antigens. They are non-replicating in mammalian cells but are capable of extended stable expression of target sequences generating an immune response in immunised individuals. The vectors selectively elicit immune to the other components of the vectors. The target antigens are expressed as intracellular polypeptides or peptides and, as such, are processed as self polypeptides or peptides and appropriately
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          60 TAGTCAGAGCCCCCGGGCAGCACAGGCCAATGCCCGTCCTTCCCCTGCAGGATGAGTAGT 119

Plasmid pITL-1 comprises a base vector for novel humanised polynucleotide vectors. The vector in Escherichia coli DH 10-beta/73 is deposited as ATCC 98400. Novel vectors comprise a human derived promoter or mammalian homologue which is functional in mammalian target tissue and cells and a sequence acceptance site (see AAV21735-36) which accepts cDNA products from RT-PCR cloning. They also contain minimal non-human components, such as a replication origin (see AAV21717) and selectable marker gene (see AAV21717-18) that are necessary for production of the vector. The novel vectors are used to express target antigens, especially tumour antigens. They are non-replicating in mammalian cells but are capable of extended stable expression of target sequences generating an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Humanised polynucleotide vectors - comprising human derived promoter and sequence acceptance site, used for the production of vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         in immunised individuals. The vectors selectively elicit immune responses to the target sequences with little or no immune response to the other components of the vectors. The target antigens are expressed as intracellular polypeptides or peptides and, as such, are processed as self polypeptides or peptides and appropriately presented on antigen presenting cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1807 BP; 419 A; 463 C; 492 G; 433 T; 0 other;

accepts cDNA products from RT-PCR cloning. The novel vectors are used to express target antigens, especially tumour antigens. They are non-replicating in mammalian cells but are capable of extended stable expression of target sequences generating an immune response in immunised individuals. The vectors selectively elicit immune response to the target sequences with little or no immune response to the other components of the vectors. The target antigens are expressed as intracellular polypeptides or peptides and, as such, are processed as self polypeptides or peptides and appropriately
                                                                                                                                                                                                                                                                                                                                                                                  94.4%; Score 214.4; DB 19; Length 2308; 99.1%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     32; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           a human HER. 2/neu nucleic sequence. PITL-HEREZ/neu was used to evaluate the toxicity of anti-tumour vaccination in rats, and in phase I and phase II trials to evaluate polyuclectide vaccination in advanced breast cancer. Novel humanised vectors, which can be based on PITL, comprise a human-derived promoter or mammalian homologue which is functional in mammalian target tissue and cells and a sequence acceptance site which accepts cDNA products from RT-PCR cloning. The vectors are non-replicating in mammalian cells but are capable of extended stable expression of the target sequence, generating an immune response in immunised individuals. The vectors selectively elicit immune responses to the target sequences with little or no immune response to the carget

                 Humanised polynucleotide vectors - comprising human derived promoter and sequence acceptance site, used for the production of vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 humanised green fluorescent protein (GFP) reporter sequence (see AAV21725). Novel humanised vectors comprise a human-derived promoter or mammalian homologue which is functional in mammalian target tissue and cells and a sequence acceptance site which excepts cDNA products from RT-PCR cloning. pITL-GFP was used to examine the kinetics of expression of a reporter sequence from such vectors in an animal model (Fisher 344 rats). Toxicity from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Plasmid pITL-GFP comprises base vector pITL (see AAV21724) and a

                                                                                           stable expression of target sequences generating an immune response in immunised individuals. The vectors selectively elicit immune responses to the target sequences with little or no immune response to the other components of the vectors. The target antigens are expressed as intracellular polypeptides or peptides and, as such, are processed as self polypeptides or peptides and as such presented on antigen presenting cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the human growth hormone (hGH) gene; it is desirable for cDNA coding for a human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cells, the enzyme human GDP-L-fucose: beta-D-galactoside 2-alpha-L-fucosyltransferase (also called alpha 1,2 FT) or human GDP-L-fucose: beta-D-galactoside 2-alpha-L-fucosyltransferase (also called alpha 1,2 FT) or human GDP-L-fucose: beta-D-N-acetylglucosamide 3/4 alpha-L-fucosyltransferase (also called alpha 1,3/4 FT). The enzyme is expressed under the control of a gut epithelial cell-specific promoter and Helicobacter pylori adheres to the transgenic cells. The transgenic mouse and intestinal epithelial cells from it are useful as models for screening compounds for the ability to inhibit adhesion of H. pylori to gut epithelial cells. The first 617 nucleotides of the present chimeric sequence encode the promoter from rat liver fatty acid binding protein (Fabpl) which can direct foreign gene expression to the pit cell inneage of the mouse gastric epithelium, to proliferating and non-proliferating cells in intestinal crypts, as well as to the four principal differentiated cell lineages along the crypt-to-villus axis coft the small intestine. The remainder of the chimeric sequence corresponds to exon 1 of the human growth hormone (NGH) gene, into which a sequence coding for a human fucosyltransferase (NET) can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               121 AGTGCCTCTCCTGGCCCTGGAAGTTGCCACTCCAGTGCCCACCACCAGCCTTGTCCTAATAAA 180

No hGH will be produced because the initiator Met codon and the first translation stop codon will be from the hFT sequence and there is no ribosome re-entry sequence. The hGH exon 1 ensures efficient splicing of the transgene primary transcript, improves stability of the cytoplasmic hFT mRNA and allows transgene expression to be monitored by in situ hybridisation using a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .

This invention relates to a DNA construct comprising an erythropictin-inducible sequence represented by the present sequence. The HS2-betaglobin-hGH transgene comprises the hypersensitive site (HS2) element from the human beta-globin locus control region, the juvenile beta globin promoter isolated from sheep, and the human growth hormone (MGH) gene. The transgene results in osteopathic activity, when used in gene therapy. The DNA construct is useful for the treatment of osteopaenias, such as osteoporosis.
Erythropoietin-inducible transgene; human; sheep; juvenile beta globin; human growth hormone; hGH; osteopathic; osteopaenia; osteoporosis; hypersensitive element; HS; locus control region; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New DNA construct comprising an erythropoietin-inducible sequence, an erythroid-specific enhancer sequence and coding sequence of interest useful for treating osteopenia, particularly osteoporosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         121 AGTGCCTCTCCTGGCCCTGGAAGTTGCCACTCCAGTGCCCACCACCAGCCTTGTCCTAATAAA 180

the present sequence represents a human growth hormone 3' UTR/poly(A) signal sequence. The invention provides a pIL0697 plasmid comprising of a CMV promoter/enhancer transcriptionally linked to a codon portinised human IL-2 coding sequence (AAV3342) and the present human growth hormone 3'-untranslated region/poly(A) signal. Also, a 5' UTR (AAV3344) may be present between the 3' of the promoter region and the 5' of the IL-2 coding region. The invention also provides a composition for delivery and expression of a human IL-2 coding sequence in mammals, comprising: (a) a cationic lipid e.g. DOTMA, a neutral co-lipid e.g. lipid cholestrol and (b) a plasmid as described above. The plasmid composition may be used in gene therapy, especially therapy of tumours, as IL-2 is involved in stimulating proliferation of helper 7 cells. The claimed antitumour effect of the above formulations does not only depend on the expression level of IL-2 but is also a function of the non-DNA formulation components, with the effect being greater than merely additive. Also, as administration of high doses of IL-2 than merely additive. Also, as administration of high doses of IL-2 to rectain results in significant toxicity-related side effects, e.g. fever, fluid retention and vascular leak syndrome, the present composition is claimed to avoid such problems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   121 AGTGCCTCTCCTGGCCCTGGAAGTTGCCACTCCAGTGCCCACCACCACCACTGTCCTAATAAA 180

This sequence represents the 3' unt4ranslated region from a human growth hormone gene. The invention relates to a novel plasmid comprising a cytomegaLovirus (CMY) promoter transcriptionally linked with an interferon alpha (IFN-alpha) coding sequence, and a growth hormone 3'-untranslated region (UTR). The plasmids can be used for treating a mammalian condition or disease, particularly cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human growth hormone 3'UTR; anti-angiogenic agent; expression plasmid; cancer; gene expression; mRNA stability; transfection; tumour activity; cytostatic; gene therapy; lung metastatic tumour; ss.

                                                                                                                                                                                                         -anglogenic agent. This was used in the construction of expression plasmid incorporating an anti-anglogenic agent for the treatment of mammalian diseases, especially cancer. This 3'UTR influences gene expression by controlling the accuracy and efficiency of RNA processing, manA stability and translation. The plasmids can be used for (in vivo) transfection of a cell in situ in order to modulate tumour activity. Anti-anglogenic gene inhibits growth of solid tumour and lung metastatic

The present sequence is one of 18 nucleic acid molecules encoding novel human secreted proteins. The nucleic acids and proteins may be used in the prevention, diagnosis and treatment of diseases including immune disorders (e.g. multiple sclerosis, systemic lupus erythematosus and human immunodeficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and Gaucher; sdiseases), cardiovascular diseases.

C. e.g. Scimitar syndrome, chaga's cardiomyopathy and coronary arteriosclerosis), anglogenic disorders (e.g. corneal graft neovascularisation and diabetic retinopathy), neurological disorders (e.g. Huntington's chorea, Alzheimer's disease and Parkinson's disease), infectious diseases and/or for promoting wound healing, regeneration and/or chemotaxis. The nucleic acid molecules may also be used as DNA similar nucleic assays to detect, and quantitate the presence of similar nucleic acid sequences in samples. The polypeptides may also be used as antigens in the production of antibodies and in assays to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; growth hormone releasing hormone; GHRH; osteoporosis; cachexia; growth disorder; burn; sepsis; trauma; atherogenic; cardiovascular; chronic obstructive pulmonary disease; atherosclerotic; cerebrovascular; peripheral vascular disease; haemophilia; muscular atrophy; aging;

New vector for controlled expression of growth hormone releasing hormone - useful for treating osteoporosis and cachexia in humans, and to increase growth and improve the immune system of animals

Disclosure; Fig 6; 121pp; English.

hormone releasing hormone (GHRH). It is used in the construction of the vectors of the invention. The specification describes vectors comprising a cassette containing at east one sequence required for expression of GHRH, including a promoter, a linker that connects the 5' flanking sequence to a nucleic acid and includes a position for insertion of GHRH DNA but lacks the coding sequence of a gene naturally associated with it, 3'-flanking region, including untranslated and/or non-coding sequences, placed 3' to the position for insertion of GHRH DNA, and comprising a 3'-untranslated region (UTR). The vectors are used to deliver and express the human GHRH gene to a cell (Specifically human), in vivo or ex vivo, especially for treatment of osteoporosis, cachexia or growth disorders, but also burns, sepsis, trauma, chronic obstructive pulmonary disease, atheroselerctic, atherogenic, cardiovascular, cerebrovascular or peripheral vascular diseases, haemophilia, muscular atrophy (especially where associated with aging), muscular dystrophy etc. The present sequence contains the DNA sequence encoding human growth 

Sequence 1441 BP; 258 A; 474 C; 407 G; 302 T; 0 other;

Sloma,A., Sternberg,D., Adams,L.F. and Brown,S.
Methods for producing polypeptides in mutants of bacillus cells
Patent: US 5958728 A. 32 28-SEP-1999;
Location/Qualifiers
                                                                                                                                                                                                                                                                                                   1 (bases 1 to 40)
Sloma,A. and Christianson,L.
Nucleic acids encoding polypeptide having protease activity
Patent: US 5891701-A 46 06-APR-1999;
Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
